Convenience Store POS Solution

Do you have a small convenience store or a quick food store at a gas station? Our systems can help you increase your profits and maintain a tighter control on your inventory and employees. A point of sale system is an easy way to improve your store's profits.

One of the most important parts of a point of sale system at a convenience store is speed and fast customer throughput. Customers want to come in and go out without waiting in lines. The less time they have to wait, the more likely they will make a purchase.

Inventory Maintenance - One of the most essential parts of any point of sale system for a business owner is knowledge of your inventory. Our systems ensure you always have items in stock and make reordering simple. It lets you add items using a barcode and retain its cost, price, stock level, department, and the vendor you purchase it from.

Reporting - Watching sales, costs, and inventory will help fine tune your business model. A business owner's knowledge of how items sell during different periods will let said owner take advantage of this knowledge and increase profits.

Credit Card Processing - Fast checkout with credit cards is feasible by using an internet connection. Without any additional hardware, this system will set up everything directly through the point of sale station. Processing a credit card will take a mere 3 to 5 seconds.

Purchase Order - Reordering low inventory is quick and easy to do. Each inventory item can be assigned a vendor, a reorder level, and a reorder quantity. Generate a purchase order by vendor or simply add all the items that have fallen below the reorder level.

A computerized point of sale system at your store will increase your profits. It will speed customer checkout, reduce theft, reduce employee theft, and improve accuracy. It will help reduce your inventory where needed, increase inventory where needed, and help realize which items are providing you with the greatest amount of profit.
